Base commit: 3bf2d76

1. Two independent dimensions and why Bridge fits

The application has two dimensions that change independently. The first is what is drawn: the abstraction Shape with subclasses Circle (radius 2) and Square (side 3). The second is how it is drawn: the implementor interface Renderer with VectorRenderer, RasterRenderer and as the extension, AsciiRenderer.

Without Bridge, every combination would need its own class (VectorCircle, RasterCircle, VectorSquare, and so on), and each new renderer would add one class per shape.

2. UML class diagram
